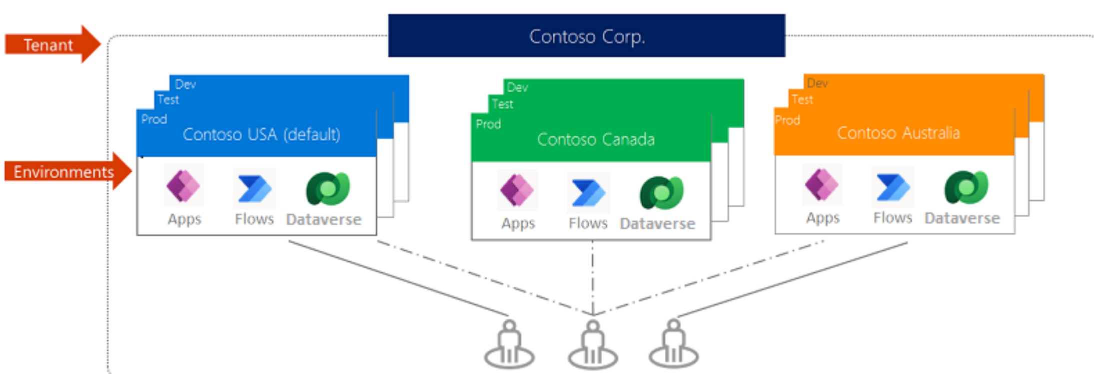
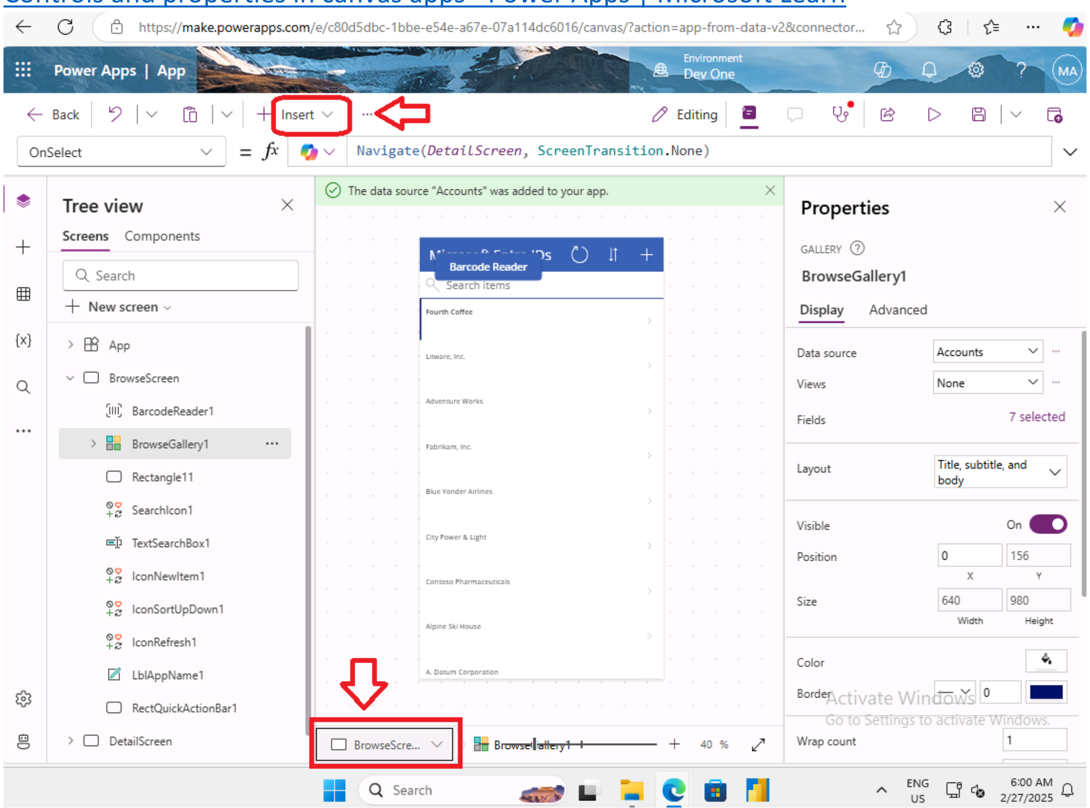
- https://aka.ms/ppac URL in labs to get to portal
    - Resolves to https://admin.powerplatform.microsoft.com/
- Data requirements - Training | Microsoft Learn
- Dataflows - Training | Microsoft Learn
    - Dataflows are cloud-based extract, transform, and load (ETL) services that help you ingest data from various sources and then convert it into an analysis-ready form.
- What is Power Apps? - Power Apps | Microsoft Learn
    - Understand Power Apps Studio - Power Apps | Microsoft Learn
        - The Editor
    - Overview of building canvas apps - Power Apps | Microsoft Learn
        - Design and build a business app from a canvas in Microsoft Power Apps without writing code by dragging and dropping elements onto a canvas,
        - Create Excel-like expressions for specifying logic and working with data.
        - Integrate business data
        - Share your app - browser - mobile device
        - Embed in SharePoint, Power BI, Teams or model-driven app for mobile or tablet devices, where you'll need task-based applications.
        - ModelDrivenFormIntegration control properties and actions
            - This control is responsible for bringing contextual data from the host model-driven app to the canvas app
        - endlist



- [Overview of building a model-driven app with Power Apps - Power Apps | Microsoft Learn] (Looks Like Power BI for Dataverse)
  - Without a data model housed within Microsoft Dataverse, you can't create a model-driven app.
  - Process driven apps that are data dense - make it easy for users to move between related records.
  - Forms, views, and charts and dashboards to tables using an app designer tool.
  - Relationships connect tables together in a way that permits navigation between them and ensures that data is not repeated unnecessarily.
  - [App navigation in model-driven apps - Power Apps | Microsoft Learn]
  - Area – Group – Page (Subarea that contains data)
  - Page – Tables, dashboards, URLS – Custom
  - Data is stored in tables in Microsoft Dataverse, and forms provide the user interface (UI) for interacting with the data. Controls on the form allow users to visualize data that is in table columns.
- [Controls and properties in canvas apps - Power Apps | Microsoft Learn]



- Space

Dataverse

- What is Microsoft Dataverse? - Power Apps | Microsoft Learn
    - Dataverse allows data to be integrated from multiple sources into a single store, which can then be used in Power Apps, Power Automate, Power BI, and Power Virtual Agents along with data that's already available from the Dynamics 365 applications.
    - Table is a set of rows (formerly referred to as records)
        - View data in a table - Training | Microsoft Learn
    - Columns (formerly referred to as fields/attributes).
    - Environment Maker and Environment Admin are the only predefined roles for environments that have no Dataverse database.
    - As a Dataverse database, a user must be assigned the System Administrator role instead of the Environment Admin role to have full admin privileges.
    - Terminology updates
    - Virtual entities and dual-write are part of the shared data layer for the convergence of finance and operations apps and the Dataverse platform.
        - Dual-write is your best option when your data resides completely inside Dataverse
        - Virtual entities seamlessly represent external data inside of Dataverse without replicating the data.
    - Every table contains a Primary name column that is used to reference the table row within the user interface.
    - Primary key column is a GUID.
    - Column types
    - Define rollup columns with Power Apps - Power Apps | Microsoft Learn
    - Choice columns provide a set of options that are displayed in a drop-down control on a form or in picklist control when you're using Advanced Find.
    - Autonumber columns offer many options for the type of autogenerated number that you want to generate.
    - Relate one or more tables - Introduction - Training | Microsoft Learn
        - An easy way to create a table relationship is by creating a column with data type Lookup to another table.
        - Creates a many-to-one relationship.
    -
        - `Correspondingly, creating a one-to-many relationship creates a lookup column on the related table.
    - *Exercise - Create two tables and relate them by using a one-to-many relationship - Training | Microsoft Learn
    - *Exercise - Create a cloud flow with a Dataverse connector - Training | Microsoft Learn
    - FetchXML is a proprietary XML-based query language of Dataverse that you can use to query data.

RBAC & Roles

A user's access to a record is the combination of all their security roles, the business unit they're associated with, the teams they're members of and the records that are shared with them.

1. Security in Microsoft Dataverse - Power Platform | Microsoft Learn
    a. Combine business units, role-based security, row-based security, and column-based security
    b. Users are authenticated by Microsoft Entra ID.
    c. Licensing is the first control-gate to allowing access to Power Apps components.
    d. Manage Microsoft Dataverse settings - Power Platform | Microsoft Learn
        i. Ability to create applications and flows is controlled by security roles in the context of Environments.
    e. A user's ability to see and use apps is controlled by sharing the application
2. Security concepts in Microsoft Dataverse - Power Platform | Microsoft Learn
    a. Business Unit – for grouping users.
    b. Teams are owned by a Business Unit.
    c. Every Business Unit has one default team that is automatically created when the Business Unit is created.
3. Configure user security in an environment - Power Platform | Microsoft Learn
    a. Summary of resources available to predefined security roles
4. Configure user security in an environment - Power Platform | Microsoft Learn
    a. Create a custom security role with minimum privileges to run an app
5. Create users - Power Platform | Microsoft Learn
6. Control user access to environments: security groups and licenses - Power Platform | Microsoft Learn
    a. Dataverse group team
    b. Create a security group and add members to the security group
    c. Create a user and assign license
    d. Associate a security group with an environment

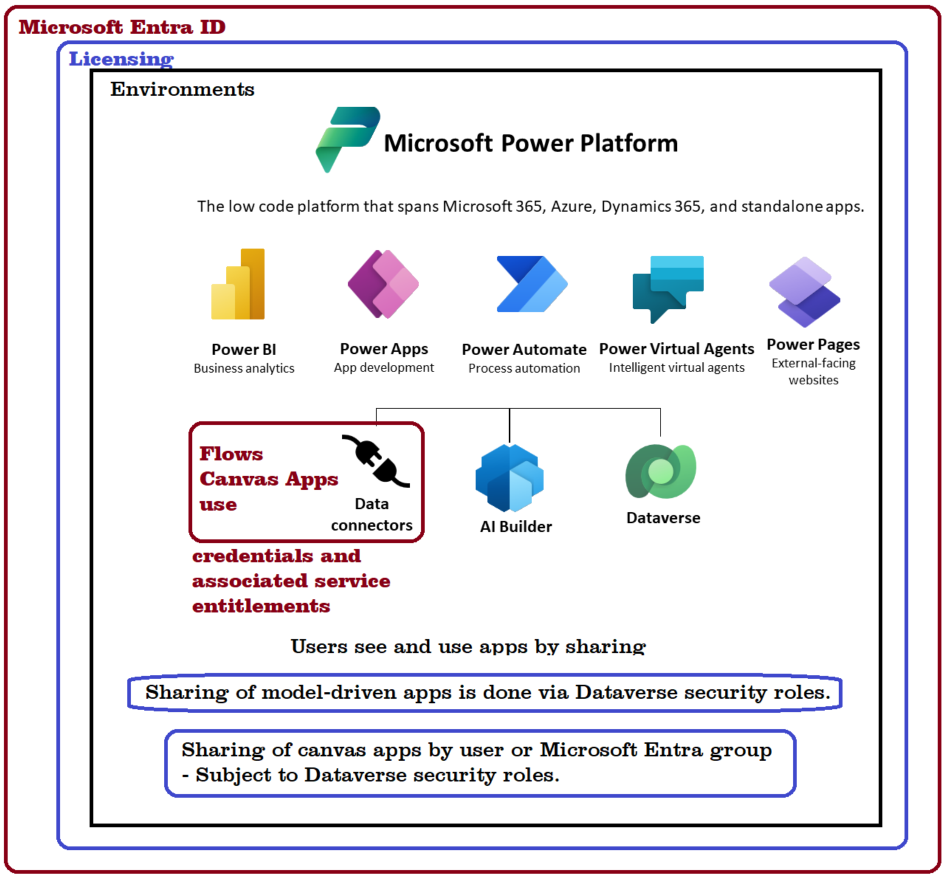
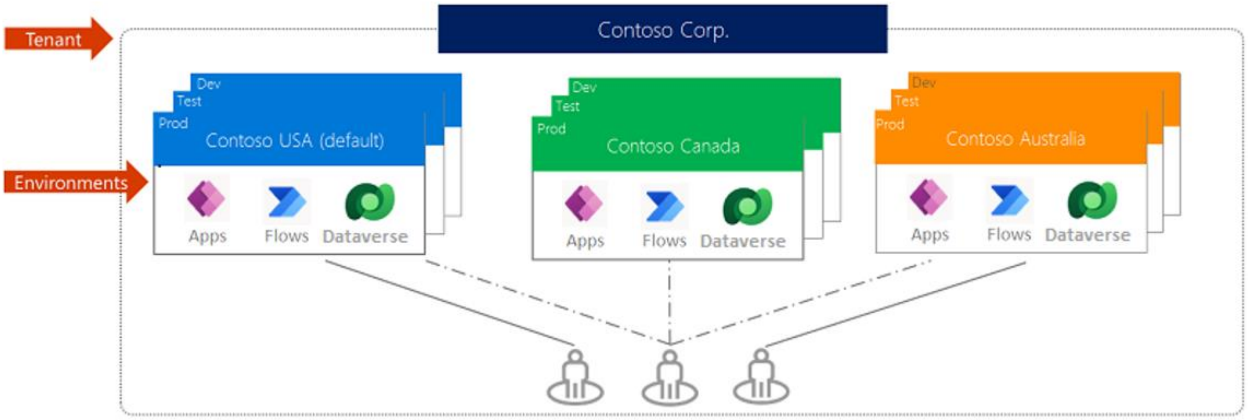
Security Boundaries



7.
8. A key concept of Dataverse security to understand is that privileges are accumulative with the greatest amount of access prevailing.
9. space

Parts



Power BI, Power Apps, Power Automate, Power Virtual Agents, and Dynamics 365 applications can get the data produced by the dataflow by connecting to Dataverse, a Power Platform dataflow connector.

- Tables: Allows you to manage the Microsoft Dataverse tables deployed in this environment. You can easily create new tables and perform tasks such as modifying the different forms, views, and relationships in the Dataverse instance.
- Connections: Allows you to manage the connections being used by apps in this environment.
- Flows: Provides access to any flows created for this environment.
- Chatbots: Provides access to any chatbots created for this environment.
- AI Models: Provides access to AI builder models for this environment.
- Solutions: Provides access to any Solutions deployed to this environment.
- Cards: Provides access to Cards created in this environment.
- Choices: Allows you to manage the choice columns in this environment.
- Connections: Allows you to manage the connectors used in this environment.
- Dataflows: Provides access to Dataflows used in this environment.
- Power Platform: Provides access to other Power Platform Maker portals.

Managed Environments overview - Power Platform | Microsoft Learn a suite of premium level capabilities admins can use to manage Power Platform at scale.

1. Cards for Power Apps overview - Power Apps | Microsoft Learn
    a. Card forms are used in views for model-driven apps.
    b. Present information
    c. Added to views by using the Read-only Grid control.
2. Tutorial: Customize a gallery in Power Apps - Power Apps | Microsoft Learn
    a. A list of records is called a gallery
3. Customize forms in canvas apps - Power Apps | Microsoft Learn
    a. Each form comprises one or more cards, each of which shows data from a particular column in the data source.
    b. C.R.U.D. Ops
        i. Display form control
        ii. Edit form control

4. Main forms - are the primary user interface where people view and interact with their data.
5. Quick Create - Model-driven apps and Dynamics 365 mobile apps use quick create forms for creating new rows. Space.
6. Quick view form can be added to another form as a quick view control.
7. space

Power Apps, Power Pages & Canvas Apps

Power Pages and **Canvas Apps** are both specialized product types *under* the broader **Power Apps** umbrella framework. Microsoft positions Power Apps as the overarching suite, meaning any conversation about the crossover between them is a comparison of specialized tools within the same application platform [1]. [1, 2, 3, 4]

- Power Pages allow you to build secure, public-facing websites that anyone on the internet can access without signing in.
- Canvas Apps are designed for internal organizational use and require users to log in with corporate accounts to access data and apps

The visual table below details how these development tools cross over, share components, and differ based on target audience and deployment needs:

Architectural & Functional Breakdown

Feature / Capability [1, 2, 3, 4, 5]	**Power Pages**	**Canvas Apps**	**Power Apps (Overarching Suite)**
Core Purpose	Public-facing websites and secure external portals.	Tailored, pixel-perfect internal task and mobile apps [1, 4].	The complete ecosystem enclosing all app/portal types [1].
Target User Base	**External users** (customers, partners) and internal staff.	**Internal employees** within your Microsoft 365 tenant [1, 4].	Scalable to both internal enterprise users and external guests [1].
Data Engine (Crossover)	Shared **Dataverse** integration for tables, forms, and views [5].	Connects to **Dataverse**, SharePoint, SQL, and 1,000+ APIs [1].	Standardizes on **Dataverse** as the native cloud data layer [1].
Design Framework	Responsive Bootstrap-based web grid system [5].	Absolute positioning (Drag-and-drop canvas canvas) [1, 4].	Supports web grid systems, canvas layouts, and model-driven UI [1].
Authentication System	External providers (Azure AD B2C, Google, Facebook, Okta).	Native Microsoft 365 / Entra ID enterprise login [1, 4].	Handles both enterprise IAM and custom external federated identity [1].

Core Areas of Crossover

- **The Dataverse Connection:** This is the strongest point of crossover. A table created in Microsoft Dataverse can simultaneously drive the data engine behind an internal **Canvas App** for your employees and populate a public-facing data form on a **Power Pages** website for your vendors [5]. [1]
- **Power Automate Extensibility:** Both platforms natively use Power Automate cloud flows to run backend automation, process payments, send email alerts, or transfer files when a user interacts with the UI. [1, 2, 3, 4, 5]
- **Component Sharing (PCF):** Professional developers can build custom user interface elements using the **Power Apps Component Framework (PCF)**. Once built, these identical components can be deployed inside both Canvas Apps and Power Pages sites. [1, 2]
- **Unified Lifecycle (ALM):** Both app types are packaged into Microsoft Power Platform **Solutions**. This allows IT administrators to move a bundled package containing your Canvas Apps, Power Pages configurations, and cloud flows across dev, test, and production environments together.

When to Use Which?

- Choose Power Pages if you need to build a secure, authenticated website where people *outside* your company corporation (like citizens, patients, or contractors) can log in and submit data. [1, 2, 3, 4, 5]
- Choose Canvas Apps if your target audience is internal, and you need a highly specific mobile layout, offline capabilities, or a tool that talks to legacy sources like SharePoint lists

The Core Differences

1. Anonymous & External Access

- **Power Pages:** Specifically built to support anonymous users (such as the general public) or large groups of external users (like customers, vendors, or partners) who do not have an active Microsoft tenant account. [1, 2]
- **Power Apps:** Every user who accesses a standard or model-driven Power App must be authenticated within your Microsoft organization and have an appropriate Power Apps License assigned. [1, 2]

2. Scalability & Pricing Models

- **Power Pages:** Uses capacity-based licensing (e.g., pricing per number of authenticated logins or anonymous page views per month), making it highly cost-effective for large-scale public or customer-facing scenarios. [1, 2]
- **Power Apps:** Primarily uses per-user licensing. This works perfectly for internal teams but becomes prohibitively expensive if you want to give access to thousands of external clients. [1, 2]

3. Web Development & UI/UX Design

- **Power Pages:** Generates responsive, web-standards-based HTML/CSS sites optimized for modern browsers and search engines. It includes enterprise-grade website capabilities natively, such as document uploads, multi-step forms, and custom branding for the web. [1, 2, 3, 4]
- **Power Apps:** Creates application interfaces that behave more like a standard software program or mobile app. While highly functional for data entry, they are not designed to be public-facing web portals. [1, 2, 3, 4, 5]

4. Identity Management

- **Power Pages:** Integrates seamlessly with external identity providers, allowing users to sign up or log in using personal accounts like LinkedIn, Google, Facebook, or a custom login system.
- **Power Apps:** Relies strictly on Microsoft Entra ID (formerly Azure Active Directory) for authentication

Quick Starts

1. *Exercise - Create a custom table and import data - Training | Microsoft Learn
2. *Exercise - Training | Microsoft Learn
    a. Create a model-driven app
3. *Form elements - Training | Microsoft Learn
    a. Form order defines the order in which a user sees the available forms, within the set of allowed forms for their security roles.
    b. You can assign a security role (or collection of security roles) to control access to the form.
4. *Exercise - Create your first app in Power Apps - Training | Microsoft Learn

Things to Remember

1. Dataverse there's also a column called the primary column
2. A virtual table is a custom table in Microsoft Dataverse that has columns containing data from an external data source, such as Azure SQL Database or SharePoint.
3. Schema name: This is the internal name of the column created in the database. By default, the schema name is automatically created for you based on the Display name.
4. To hide a standard table, change the security role privileges for your organization to remove the Read privilege for that table.
5. Power Apps web studio
    a. Environment - Solution – Publisher – App –
    b. 
c. 
d. [Use Power Fx - Training | Microsoft Learn]
e. DAX
f. [Microsoft Power Platform CLI - Power Platform | Microsoft Learn]
    i. Code vs. No Code
g. [Solutions in Power Apps - Power Apps | Microsoft Learn]
    i. Used to transport apps and components from one environment to another or to apply a set of customizations to existing apps.
    ii. Can contain one or more apps as well as other components such as site maps, tables, processes, web resources, choices, flows, and more.
    iii. For implementing application lifecycle management (ALM) in Power Apps and other Power Platform products, such as Power Automate.

6. Galleries provide a powerful way to visualize tabular data
    a. Select the template by selecting in the first cell of the gallery, or you can select the pencil icon in the upper-left corner when the entire gallery is selected.
    b. Test your gallery directly on the canvas by pressing the Alt key
7. Compare, you add it to a collection called CompareList.
8. Main Screen and Preview the app by selecting the Play button in the upper right.
9. Copresence within Power Apps Studio that allows you to collaborate with others in canvas apps.
10. [Power Apps pattern: Project management - Power Apps | Microsoft Learn]

What is Work or Task aka Dataverse Solution

11. In Order of Steps
    a. Business Process Flow (BPF)
    b. Workflows: Associate workflows with stages to automate specific actions at each stage.
    c. Workflows can send emails, update fields, or trigger further automation.
    d. Flow Steps: Within workflows, define individual steps performing specific actions.
    e. These can be manual tasks like user approvals or automated actions like data updates.
12. Humans or Automate Until Approval Step
    a. How
13. Source Connect Target
    a. Triggers
    b. Actions: Steps performed within the flow, like sending emails, creating records, or
    c. performing calculations.
    d. Conditions: Branch the flow based on specific criteria.
    e. Loops: Repeat actions a set number of times or until a condition is met.
    f. Variables: Store and reference information throughout the flow.
    g. Connectors: Bridge the gap between Power Automate and other services.Wash Rinse Repeat
    h. Schema: Definition of data exchanged between Power Automate and the service.
    i. Branches: Split the flow based on conditions using "If" statements.
    j. ▯ Loops: Repetitive actions using "For Each" or "Until" loops.
    k. ▯ Conditions: Evaluate criteria to determine flow direction.
    l. ▯ Error Handling: Capture and manage errors using "Try...Catch" blocks and continue
    m. execution.
    n. ▯ Variables: Store and manipulate data within the flow using dynamic values.
14. What is the Riverbed or Highway
15. What is the Baton being Passed in the Relay Race
16. [Explore Power Automate's automation center - Power Automate | Microsoft Learn]
    a. Comprehensive visualizations that enable you to monitor the health of your automations, quickly detect issues or trends and troubleshoot problems
    b. Underlying data is managed through Dataverse tables, secured via role-based access control (RBAC). In standard Dataverse environments (production, trial, sandbox, developer),
17. Workflow logs
    a. Viewing logs: Access workflow logs through the Power Platform admin center or directly
    b. within the specific workflow designer.
    c. Filtering and searching: Filter and search logs based on specific criteria like date, time,
    d. workflow name, or error code to locate relevant information quickly.
    e. Understanding log data: Interpret the information within the logs, which may include
    f. timestamps, user information, trigger events, execution details, and error messages.

   g. Alerting and reporting: Configure alerts to notify you of critical errors or unexpected behavior within the workflow. Additionally, use the logs to generate reports for auditing purposes or analyzing workflow performance trends.
18. Backup and restore environments:
    a. Regularly back up environments to facilitate recovery in case of errors or accidental data loss.
    b. BUP B4 Delete Resources?
19. Auditing - Training | Microsoft Learn
20. Use Dataverse community tools for data manipulation - Training | Microsoft Learn
    a. XrmToolBox
21. Azure Synapse Link to Dataverse
    a. Handle high-volume data scenarios with near real-time information.
    b. Enables continuous replication of Dataverse table data to either an Azure Data Lake Storage Gen 2 account or an Azure Synapse Workspace. You can then use it to run analytics such as Power BI reporting, Microsoft Azure Machine Learning, Data Warehousing, and other integration scenarios.
22. AI - Training | Microsoft Learn
23. Cognitive Services is a suite of prebuilt AI services
24. Use QR codes - Training | Microsoft Learn
    a. Barcode scanner control in Power Apps, you can use your mobile phone or device to scan a barcode

26. Data format options | Databricks Documentation
27. Endlist

Dynamics 365 Defined

Dynamics 365 apps and AI agents represent a massive leap in functional complexity compared to Power Apps and Power Pages. While the Power Platform gives you the blank-canvas building blocks to create your own tools, Dynamics 365 provides pre-built enterprise systems, and autonomous AI agents automate the actual work inside them. [1, 2, 3]

The entire ecosystem stacks up as follows:

Ecosystem Comparison

Tool / Technology [1, 2, 3, 4, 5]	Primary Purpose	User Experience Focus	Data Target
Power Pages	**Public-facing portals**	Responsive web design & anonymous access	Dataverse & External APIs
Power Apps	**Custom internal utilities**	Task-specific mobile or desktop forms	Over 600+ Data Sources
Dynamics 365 Apps	**Pre-built business operations**	Out-of-the-box departmental workspaces	Enterprise Dataverse
Autonomous Agents	**Hands-free AI task execution**	Conversational or trigger-based automation	Contextual App Systems

---

What Dynamics 365 Apps Do

Dynamics 365 apps are a suite of **pre-packaged, enterprise-grade business modules** (like Dynamics 365 Sales, Customer Service, Supply Chain, and Finance). [1]

- **Out-of-the-Box Industry Logic:** Instead of building a CRM or ERP system from scratch using Power Apps, Dynamics 365 gives you fully formed schemas, workflows, and regulatory logic ready to go on day one. [1, 2]
- **Unified Enterprise Engine:** Power Apps and Power Pages are actually the customization engines used to extend Dynamics 365. If you need standard corporate pipelines (like tracking global inventory or managing complex B2B sales pipelines), you use Dynamics 365. [1, 2, 3]

What Autonomous Agents Do

Built primarily using Microsoft Copilot Studio, AI agents are **autonomous digital workers** that live inside or sit on top of your applications. [1, 2, 3, 4, 5]

- **Replacing the UI with AI:** Power Apps, Power Pages, and Dynamics 365 all require a human to click buttons, fill fields, and read menus. An AI agent bypasses the traditional interface by acting on natural language instructions. [1, 2, 3, 4, 5]

- **Independent Execution:** Unlike standard apps that sit waiting for human inputs, autonomous agents can monitor your emails or data feeds, reason through complex decisions, and execute multi-step workflows across systems without human intervention. [1, 2, 3, 4, 5]
- **Cross-System Orchestration:** An agent can take a request submitted by a customer via a *Power Pages* site, validate the user's account details inside *Dynamics 365*, and trigger a *Power App* workflow to alert a regional manager—all in seconds
